The designation system of the INA and FAG brands has been harmonised. This catalogue contains, for the first time, the new ordering designations, which are currently only valid for Europe. Customers outside Europe are requested to continue using the old ordering designations (please see the comparison on page 32).

Mechanical mounting and dismounting of rolling bearings

Mechanical mounting and dismounting of rolling bearings

Cylindrical bearing seats

Smaller bearings can be driven cold onto the shaft or into the housing for normal tight fits.

To prevent bearing damage, the fitting forces must always be applied to the tightly fitted ring.

FAG **mounting tool sets** allow cost-effective and safe **mounting** of rolling bearings with bore diameters of 10 to 50 mm or outside diameters of 16 to 110 mm. They can also be used to easily mount sleeves, intermediate rings, seals and similar parts. Tightly fitted inner rings can be driven onto the shaft or outer rings into the housing bore by hitting the mounting sleeve with the hammer. This prevents the mounting forces being transmitted through the rolling elements and raceways, which can lead to damage. The carefully matched FAG precision parts ensure that the forces are uniformly transmitted to the side faces of the bearing rings.

Great care is also required during **dismounting**. The extraction tool must always be applied to the ring to be removed.

Mechanical FAG **extractors** can be used to dismount small rolling bearings up to approx. 100 mm bore diameter that are located with a tight fit on a shaft or in a housing. The extraction force is normally applied by means of a threaded spindle.

A hydraulic spindle facilitates work with hydraulic FAG extractors for larger rolling bearings. Extraction forces of up to 400 kN (40 tonnes) can be generated in this case.

Appropriate mounting sleeves such as those included in the FAG mounting tool sets can be used to drive on small bearings using light hammer blows.

An extractor with adjustable arms grips under a tightly fitted inner ring. Dismounting can be made easier by means of extraction slots.

Mechanical mounting and dismounting of rolling bearings

Tapered bearing seats

The inner ring of a bearing with tapered bore is always mounted with a tight fit. The bearing can be either seated directly on a tapered shaft or fixed to a cylindrical shaft using an adapter or extraction sleeve. When the inner ring is pushed on, it is expanded and the radial internal clearance is reduced. The reduction in radial internal clearance is therefore valid as a measure of the seating of the inner ring. To prevent bearing damage, the inner ring must not be pushed on too far.

For guide values for the reduction in radial internal clearance, see FAG publication WL 80 100 "Mounting of rolling bearings". Feeler gauges for measuring the radial internal clearance are described in FAG publication IS 1 "Mounting and Maintenance of Rolling Bearings". Another method for measuring the correct internal clearance is measurement of the axial displacement.

Locknuts can be easily tightened and loosened on shafts, adapter sleeves and extraction sleeves using **socket wrenches**.

FAG **hook wrenches** can be used to tighten and loosen locknuts (precision locknuts) on shafts, adapter sleeves or extraction sleeves.

If no torque value is specified, jointed hook wrenches, jointed pin wrenches and jointed face wrenches can be used for locknuts and precision locknuts.

Double hook wrenches are engraved with the torsion angles for the appropriate self-aligning ball bearings. The displacement and reduction in radial internal clearance can therefore be precisely set. Both kits and sets contain suitable torque wrenches.

The FAG computer program **MOUNTING MANAGER** is a user-friendly aid for ensuring the correct mounting of bearings with tapered bore. It shows suitable mounting methods, calculates the data required for mounting in relation to reduction in radial internal clearance and displacement and generates a list of the accessories and tools required. A more detailed description of the computer program can be found in TPI WL 80-57 "FAG Hydraulic nuts".

An FAG hook wrench is used to tighten shaft nuts, adapter sleeve nuts and extraction nuts simply and securely.

The FAG double hook wrench is engraved with the torsion angles for the appropriate self-aligning ball bearings.

FAG tools for mounting of rolling bearings

Mounting tool set FITTING-TOOL-ALU-10-50 for cylindrical bearing seats

FAG mounting tool set FITTING-TOOL-ALU-10-50

The FITTING-TOOL-ALU-10-50 allows particularly cost-effective mounting of many standardised rolling bearings (bore diameter of 10 to 50 mm) and other parts. The low mass of the components makes this mounting tool set very easy to handle.

Features

The tool set contains 33 different mounting rings and 3 mounting sleeves as well as a hammer. The mounting rings are made from impact-resistant plastic. This prevents metal/metal contact as well as damage to or premature wear of the bearing seatings. The mounting sleeves are made from aluminium. The head of the recoilless hammer (1 kg mass) produces no sparks. Each mounting sleeve can be pushed over the shaft end as far as 220 mm. The combination of mounting ring and mounting sleeve required for the application in question can be found in the table inside the lid of the case, see also page 5. The parts are driven on by hitting the mounting sleeve using the supplied hammer. The components of the tool set are housed in a practical case. Case dimensions:
440×350×95 mm

Included in delivery

33 mounting rings
3 mounting sleeves
1 hammer
1 case

Mass of complete tool set: 4,5 kg

FAG tools for mounting of rolling bearings

Mounting tool set FITTING-TOOL-STEEL-10-50 for cylindrical bearing seats

FAG mounting tool set FITTING-TOOL-STEEL-10-50

The mounting tool set FITTING-TOOL-STEEL-10-50 is designed for very high loads and a long operating life. The tools can also be used for pressing in or out on workshop power presses. The tool set can be used for the mounting of rolling bearings with a bore diameter of 10 to 50 mm.

Features

The tool set contains 33 different hardened mounting rings and 5 mounting sleeves made from tool steel. The nylon head of the recoilless hammer (0.7 kg mass) produces no sparks. Each mounting sleeve can be pushed over the shaft end as far as 220 mm. The combination of mounting ring and mounting sleeve required for the application in question can be found in the table inside the lid of the case, see also page 7. Integrated O rings allow parts to be joined together securely. The parts are driven on by hitting the mounting sleeve with the supplied hammer. The components of the tool set are housed in a practical metal case. Case dimensions:
370×320×70 mm

Included in delivery

- 33 mounting rings
- 5 mounting sleeves
- 1 hammer
- 1 metal case

Mass of complete tool set: 21 kg

FAG tools for mounting and dismounting of rolling bearings

Socket wrenches for tapered bearing seats

FAG socket wrenches LOCKNUT-SOCKET-KM...

Locknuts KM0 to KM20 can be easily tightened and loosened on shafts, adapter sleeves or extraction sleeves using socket wrenches LOCKNUT-SOCKET-KM...

They require less space on the circumference of the nut than hook wrenches and allow the use of ratchets and torque wrenches. For increased reliability, socket wrenches should be secured using a locking pin and rubber washer. FAG socket wrenches therefore have a hole for the locking pin and a groove for the rubber washer.

The locking pin and rubber washer are included in delivery.

FAG tools for mounting and dismounting of rolling bearings

Hook wrenches for tapered bearing seats

FAG socket wrenches LOCKNUT-HOOK-KM...

FAG hook wrenches of series LOCKNUT-HOOK-KM... can be used to tighten and loosen locknuts of size KM0 and larger on shafts, adapter sleeves and extraction sleeves.

Hook wrenches can be used to mount rolling bearings on tapered shaft seats, adapter sleeves or extraction sleeves. Extraction sleeves can also be dismounted using hook wrenches together with the extraction nuts. The table below contains dimensions, masses and allocation of the hook wrenches to the respective locknuts.

Ordering example for FAG socket wrench, suitable for threaded nuts KM18, KM19 and KM20:

LOCKNUT-HOOK-KM18-20

FAG tools for mounting and dismounting of rolling bearings

Jointed hook wrenches for tapered bearing seats

FAG jointed hook wrenches LOCKNUT-FLEXIHOOK-KM...

FAG jointed hook wrenches of series LOCKNUT.FLEXI-HOOK-KM... can be used to tighten and loosen locknuts KM.. as well as precision locknuts ZM... and ZMA... on shafts, adapter sleeves and extraction sleeves if no torque value is specified.

Due to the joint, it is possible to use a single hook wrench of series LOCKNUT-FLEXIHOOK-KM... to mount or dismount locknuts of various sizes.

Ordering example for FAG jointed hook wrench, suitable for locknuts KM14 to KM24:
LOCKNUT-FLEXIHOOK-KM14-24

FAG tools for mounting and dismounting of rolling bearings

Jointed pin wrenches for tapered bearing seats

FAG jointed pin wrenches LOCKNUT-FLEXIPIN-AM...

FAG jointed pin wrenches of series LOCKNUT-FLEXIPIN-KM... can be used to tighten and loosen precision locknuts AM15 to AM90 on shafts if no torque value is specified. FAG jointed pin wrenches can be used to mount small bearings on tapered shaft seats.

Tightening is achieved by means of axially arranged holes.

Ordering example for FAG jointed pin wrench, suitable for locknuts AM35 to AM60:
LOCKNUT-FLEXIPIN-AM35-60

Technical data

FAG tools for mounting and dismounting of rolling bearings

Double hook wrenches for tapered bearing seats

FAG double hook wrenches for tapered bearing seats

FAG double hook wrenches are intended for the mounting of self-aligning ball bearings with a tapered bore. They are available as kits, sets or individual wrenches (for a description see below).

FAG double hook wrench kits LOCKNUT-DOUBLEHOOK-KM...-KIT

FAG double hook wrench kits comprise a case containing **one** double hook wrench, one torque wrench and a user manual. The torque wrench allows a precisely defined tightening torque to be achieved at the start of the mounting operation.

FAG double hook wrench sets LOCKNUT-DOUBLEHOOK-KM...-SET

FAG offers two different double hook wrench sets. The smaller set contains four double hook wrenches, while the larger set contains five. The other items in the case are the same as in the kits.

FAG double hook wrenches LOCKNUT-DOUBLEHOOK-KM...

Individual double hook wrenches are also available, see table on page 14 below. Each double hook wrench is engraved with the torsion angles for the self-aligning ball bearings to be mounted using that particular wrench, so that the displacement and reduction in radial internal clearance can be precisely set.

Double hook wrench kits, e. g. LOCKNUT-DOUBLEHOOK-KM5-KIT and LOCKNUT-DOUBLEHOOK-KM13-KIT

Double hook wrench sets LOCKNUT-DOUBLEHOOK-KM5-8-SET and LOCKNUT-DOUBLEHOOK-KM9-13-SET

Double hook wrenches, e. g. LOCKNUT-DOUBLEHOOK-KM5 and LOCKNUT-DOUBLEHOOK-KM13

 extension piece **LOCKNUT-DOUBLEHOOK.LEVER** for large set.

FAG tools for dismounting of rolling bearings

Mechanical two-arm extractors 54 for small bearings

FAG two-arm extractors 54

Application

- For extracting complete rolling bearings of all types or tightly fitted inner rings as well as other parts, e.g. gears, that are gripped from inside or outside
- Good radial and axial accessibility of the bearing location, possibly by means of slots, is required.

Operation and handling

An extractor of suitable dimensions is selected in accordance with the bearing size and the mounting conditions. The extraction arms are adjusted on the cross arm until they have the correct span.

A self-locking device prevents the arms from slipping off when the spindle is screwed in.

Rolling bearing rings that are removed in accordance with the specifications remain undamaged. If the extraction forces are directed through the rolling elements during extraction of complete bearings, the bearings are generally rendered unusable.

Product range - two-arm extractors 54

Ordering designation	Span	Depth	Dimensions		Spindle thread	Extraction force	Mass
Two-arm extractor	mm	mm	a	b		kN	≈ kg
			mm				

PULLER54-SET, comprising a stand (WxDxH) 215×235×475 mm complete with the following 6 extractors

							15,5
PULLER54-100	80	100	14 + 1	18 + 1	M14×1,5	40	0,75
PULLER54-200	120	125	14 + 1	18 + 1	M14×1,5	40	0,9

PULLER54-400	200	175	18 + 1	26 + 2	M20×2	60	2,5
PULLER54-500	250	200	20 + 1	28 + 2	M22×2	85	3,45
PULLER54-600	350	250	20 + 1	28 + 2	M22×2	85	4,4

FAG tools for dismantling of rolling bearings

Mechanical two-arm extractors 47 for small bearings

FAG two-arm bearing extractors 47

Application

- For extracting complete rolling bearings or tightly fitted inner rings.
- Bearing rings can be in full contact with a surface, i.e. slots are not required.

Operation and handling

An extractor of suitable dimensions is selected in accordance with the bearing size and the mounting conditions. By means of the tightening shackle, the ring to be extracted can be wedged loose using the specially shaped arms. Wedging and centring on the shaft are important for extraction without damage.

Rolling bearing rings that are removed in accordance with the specifications remain undamaged. If the extraction forces are directed through the rolling elements during extraction of complete bearings, the bearings are generally rendered unusable.

Product range - two-arm bearing extractors 47							
Ordering designation	Span	Depth	Dimensions		Spindle thread	Extraction force	Mass
Two-arm bearing extractor	mm	mm	a mm	b		kN	kg
PULLER47-100	45	65	2,5	12 + 1	M10	10	0,55
PULLER47-200	90	100	2,5	14 + 1	M14×1,5	40	1,45

FAG tools for dismounting of rolling bearings

Mechanical three-arm extractors 52 for small bearings

FAG three-arm extractors 52

Application

- For extracting complete rolling bearings or tightly fitted inner rings.
- Good radial and axial accessibility of the bearing location, possibly by means of slots, is required.

Operation and handling

An extractor of suitable dimensions is selected in accordance with the bearing size and the mounting conditions. The span is adjusted by shifting the lever system on the cylinder. The lever system causes self-locking of the arms, thereby ensuring good grip during the extraction process.

Rolling bearing rings that are removed in accordance with the specifications remain undamaged. If the extraction forces are directed through the rolling elements during extraction of complete bearings, the bearings are generally rendered unusable.

Product range - three-arm extractors 52

Ordering designation Three-arm extractor	Span	Depth	Dimensions		Spindle thread	Extraction force kN	Mass ≈ kg
	mm	mm	a mm	b			
PULLER52-085	85	65	5 + 1	6,5 + 1	M10	10	0,36

PULLER52-640	640	300	22 + 2	34 + 2	M30×2	150	15,8

FAG tools for dismantling of rolling bearings

Hydraulic pressure tool 44 for small bearings

Hydraulic FAG pressure tool 44

Application

The pressure tool is normally used to loosen tightly fitted parts in conjunction with mechanical extractors.

Operation and handling

The hydraulic pressure tool generates an axial force of 80 or 150 kN, thus bringing about a significant reduction in the effort required. The spindle thread of the mechanical extraction tool is not unduly stressed as the main extraction force acts on static thread flanks.

The pressure tool PULLER44-150 features a hydraulic return mechanism, i.e. when the pressure screw is reversed, the hydraulic system automatically returns to the initial position.

The hydraulic pressure tool is applied between the shaft end and extractor spindle. The spindle is then activated. The hydraulic system is actuated by screwing in the pressure screw. The axial force generated in this way loosens the part. It can then be extracted in the normal manner with the mechanical spindle.

For safety reasons, the minimum spindle diameter and the maximum torque (see table) must be observed.

Product range - hydraulic pressure tool 44						
Ordering designation	Axial force	Stroke	Section height	Spindle diameter min.	Torque max.	Mass ≈
Hydraulic pressure tool	kN	mm	mm	mm	Nm	kg
PULLER44-080	80	7	35	M22	25	0,6
PULLER44-150	150	10	85	M30	50	1,74

FAG tools for dismounting of rolling bearings

Mechanical internal extractors 62 for small bearings

FAG internal extractors 62

Application

- For deep groove ball bearings and angular contact ball bearings. The internal extractor set comprises nine extractors and can be used on bearings with a bore diameter from 5 mm to approx. 70 mm.
- For tightly fitted outer rings.
- The inner ring bore must be easily accessible.
- Since the extraction force is directed through the rolling elements, the possibility of bearing damage cannot be excluded.

Operation and handling

The gripper segments spread out when the threaded spindle is tightened. The lip of the jaws is pressed against the back of the bearing inner ring bore. The bearing is extracted using the threaded spindle and the internal extractor with the aid of the countersupport.

Ordering designation:
PULLER62-SET (nine internal extractors with two countersupports

in a rigid metal case). The nine internal extractors with countersupport can also be ordered individually.

Product range - internal extractor set 62 with countersupports

Ordering designation 9 internal extractors with 2 countersupports (set complete in case)	Internal extractor with countersupport	For inside diameter		Depth mm	Spindle thread	Mass ≈ kg

FAG tools for dismantling of rolling bearings

Mechanical internal extractors PULLER-INTERNAL10/100-SET

FAG internal extractors PULLER-INTERNAL10/100-SET

Application

- For standard deep groove ball bearings. The set, comprising 6 sets of extraction legs and 2 threaded spindles can be used on bores from 10 to 100 mm.
- For tightly fitted outer rings.
- No dismantling of shaft.

Function

Three extraction legs grip under the outer ring shoulder of the deep groove ball bearing. The suitable combination of extraction legs and threaded spindle for the bearing size can be found in the selection table.

Ordering designation:

PULLER-INTERNAL10/100-SET

(6 sets of extraction legs and 2 threaded spindles in a practical case, case dimensions: 315×250×70 mm, total mass: 3,2 kg)

The individual parts can be ordered separately, see page 21 below.

FAG tools for dismantling of rolling bearings

Mechanical ball bearing extractors 56

FAG ball bearing extractors 56

Application

- For extracting complete deep groove ball bearings.
- For tightly fitted outer rings.
- For bearings without radial access.
- Given the fact that the extraction hooks are applied at the outer ring and the threaded spindle is applied at the shaft, the extraction force is forced through the rolling elements, which can render the bearing unusable.

Operation and handling

The claws of the device grasp the raceway edge of the outer ring between the balls and are supported by the inner ring. The bearing is extracted using a threaded spindle. Depending on the bearing size, one of three extractor sizes and one of 13 sets of claws is selected, see table on page 9. The number of arms required and their arrangement in the index plate depends on the number of balls in the bearing. Complete extractor sets consist of one extractor and three or five sets of claws as well as a wrench with a T-shaped handle in the box, see table below.

Product range - ball bearing extractors 56					
Ordering designation Ball bearing extractor set	Depth mm	With claws no.	Wrench with T-shaped handle	Spindle thread	Mass ≈ kg

FAG tools for dismantling of rolling bearings

Mechanical special bearing extractors 64 for small bearings

FAG special bearing extractors 64

Application

- For radial bearings (deep groove ball bearings and self-aligning ball bearings as well as cylindrical roller, tapered roller and spherical roller bearings). Since the number of rolling elements is not standardised, different grippers may be required for the same bearing sizes from different manufacturers. The bearing manufacturer must be specified when ordering.
- For tight fit of inner ring or outer ring.
- For cases in which the inner ring is adjacent to a shaft shoulder without extraction slots, and also where the bearing to be extracted from the shaft is still inside a housing.
- Extraction without damage is possible with proper handling.
- Max. shaft diameter 75 mm.

Operation and handling

The special extractor consists of a basic unit and a gripper, which is screwed onto the upper section of the basic unit. The gripper is closed using the left hand thread of the union nut and clamped against the inner ring with a conical clamping ring. A threaded spindle generates the extraction force.

The finger-shaped extensions of the gripper engage between the rolling elements on the raceway edge of the inner ring, behind the rollers or behind the chamfer of the bearing ring, wedging it loose. The extraction principle must be observed when selecting the suitable gripper for the respective bearing, see page 25.

Product range - special bearing extractors 64

Ordering designation Basic unit for special extractor	Dimensions				Spindle thread	Mass ≈ kg
	d mm	D	l	L		
PULLER64-400	30,5	60	78	135	M14×1,5	1,25
PULLER64-500	46	75	80	150	M20×2	2,5
PULLER64-600	66	100	92	170	M22×2	3,8
PULLER64-700	77	126	120	205	M30×2	7,8

The basic unit is selected such that the dimension d is greater than the bearing bore, for example PULLER64-700 (d = 77 mm) for rolling bearing 6015 with 75 mm bore.

FAG tools for dismounting of rolling bearings

Mechanical special bearing extractors 64 for small bearings

Grippers for special bearing extractors 64

The gripping profile of the grippers must be matched to the geometry of the bearing to be extracted. The extraction principle depends on the bearing design and the mounting position. Two grippers are required for tapered roller bearings in X and O arrangements.

Extraction principle A:

For deep groove ball bearings, four point contact bearings, self-aligning ball bearings

The bearing is grasped at the inner ring. Bearings that are located deep in a housing can also be grasped if the outside diameter of the bearing is greater than that of the basic unit.

Ordering designation for grippers:

PULLER64.COLLET-A + bearing
(e.g.: **PULLER64.COLLET-A-6000**)

Selection of basic unit and gripper

The basic unit is always selected such that the dimension d is greater than the bearing bore.

Ordering examples for special bearing extractors plus gripper:

- a) For deep groove ball bearings 6000 according to principle A:
Basic device **PULLER64-400** + gripper **PULLER64.COLLET-A-6000**

Extraction principle B:

For tapered roller bearings (fitted in X or O arrangement)

The gripper reaches over the rollers, irrespective of their number. With certain bearing dimensions, bearings that are located deep can also be extracted.

Ordering designation for grippers:

PULLER64.COLLET-B + bearing
(e.g.: **PULLER64.COLLET-B-30203-A**)

- b) For tapered roller bearing pair 30203-A in X arrangement:
Basic device **PULLER64-400** + gripper **PULLER64.COLLET-B-30203A**
gripper **PULLER64.COLLET-C-30203A**

The same grippers are used in reverse for an O arrangement of the tapered roller bearings.

Extraction principle C:

For tapered roller bearings (fitted in X or O arrangement)

The gripper engages behind the large rib of the inner ring.

Ordering designation for grippers:

PULLER64.COLLET-C + bearing
(e.g.: **PULLER64.COLLET-C-30203-A**)

Extraction principle D:

For inner ring of cylindrical roller and four point contact bearings, outer ring of deep groove ball and spherical roller bearings, wedged loose via the bearing ring chamfer

Ordering designation for grippers:

PULLER64.COLLET-D + bearing
(e.g.: **PULLER64.COLLET-D-NU315**)

- c) For cylindrical roller bearings NU315 according to principle D:
Basic device **PULLER64-700** + gripper **PULLER64.COLLET-D-NU315**

FAG tools for dismantling of rolling bearings

Mechanical extraction device 49 for small bearings

FAG extraction device 49

Application

- For all rolling bearing types.
For extracting complete rolling bearings or tightly fitted inner rings.
The extractor and the separating device are available in various sizes with openings of up to 210 mm.
- Principally for cases in which the inner ring is adjacent to a shoulder on the shaft without extraction slots. Good radial access to the bearing location is required.
- Extraction of inner rings and complete rolling bearings without damage is possible with proper handling.

Operation and handling

The two wedge-shaped halves of the separating device are inserted between the shaft shoulder and inner ring by alternately tightening the nuts. The separating device is bolted onto the extractor using two tie rods, which are fastened on the cross arm of the extraction device. The bearing or the inner ring are removed by

screwing in the spindle. A tie rod extension is available for parts

that are seated very deeply on a shaft.

Product range - extraction device 49 and separating device

Ordering designation	Span	Depth	Spindle thread	Mass
Extraction device with separating device	mm	mm	mm	kg
PULLER49-100-060	60	150	M14×1,5	1,54
PULLER49-100-075	75	150	M14×1,5	1,67

PULLER49-400-210	210	300	M30×2	18,8

FAG tools for dismounting of rolling bearings

Hydraulic standard extractors with integral hand pump

Hydraulic FAG standard extractors with integral hand pump

Hydraulic FAG standard extractors with integral hand pump are available for extraction forces of 40, 60 and 80 kN. They allow rolling bearings, gears, bushes and other components to be dismantled effortlessly. They are easy to handle and safe. The compact, light units are housed with a safety grid in a rigid case. PULLER-HYD40 is supplied with a normal arm length. PULLER-HYD60 and PULLER-HYD80 are also available with extended arms (suffix XL).

In addition to the complete devices, we also supply the arms as replacement parts and accessories.

Ordering example for normal length arms as

accessories for PULLER-HYD60-XL / replacement part for PULLER-HYD60:

PULLER-HYD60.JAW

Ordering example for extended arms as

accessories for PULLER-HYD80 / replacement part for PULLER-HYD80-XL:

PULLER-HYD80.JAW-LONG

Product range - standard extractors SPIDER with integral hand pump

PULLER-HYD80-XL	80	250	229	75	14	25	7

FAG tools for dismantling of rolling bearings

Extra strong hydraulic extractors with integral hand pump

Extra strong hydraulic FAG extractors with integral hand pump

Extra strong hydraulic FAG extractors with integral hand pump are available for high extraction forces of up to 300 kN. They allow rolling bearings, gears, bushes and other components to be dismantled effortlessly. They are easy to handle and safe. The compact units are housed in a rigid metal case. Extractors SPIDER 100 to 300 are also available with extended arms (suffix XL).

Ordering example for normal length arms as accessories for PULLER-HYD100-XL / replacement part for PULLER-HYD100:
PULLER-HYD100.JAW

Ordering example for extended arms as accessories for PULLER-HYD200 / replacement part for PULLER-HYD200-XL:
PULLER-HYD200.JAW-LONG

Product range - extra strong extractors SPIDER with integral hand pump

FAG tools for dismantling of rolling bearings

Extra strong hydraulic extractors with separate hand pump

Extra strong hydraulic FAG extractors with separate hand pump

For extra strong hydraulic FAG extractors for maximum extraction forces of 175 and 400 kN, the oil pressure is applied by a separate hand pump. They allow rolling bearings, gears, bushes and other components to be dismantled effortlessly, even in restricted spaces. The extractors are easy and safe to use. They are housed with the pumps in a rigid metal case. The two hydraulic extractors are available with a normal arm length and with extended arms on request (suffix XL).

Ordering example for normal length arms as accessories for PULLER-HYD175-XL / replacement part for PULLER-HYD175:

PULLER-HYD175.JAW

Ordering example for extended arms as accessories for PULLER-HYD400-XL / replacement part for PULLER-HYD400XL:

FAG tools for dismantling of rolling bearings

Three-section extraction plates for extractors

Three-section FAG extraction plates

Application

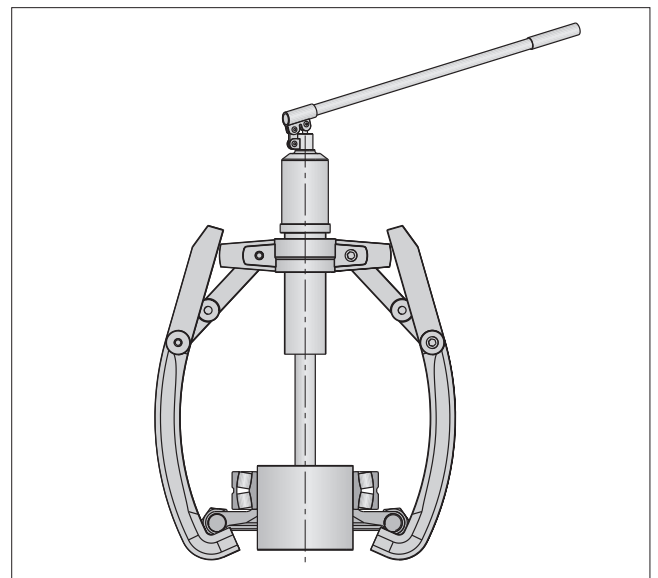

- For extraction of complete bearings or tightly fitted inner rings.
- Principally for cases in which the inner ring is adjacent to a shoulder on the shaft without extraction slots. Good radial access to the bearing location is required.
- Extraction of inner rings and complete rolling bearings without damage is possible with proper handling.

Function

The three extraction plates are pushed, by means of alternately screwing in the nuts, between the shaft shoulder and inner ring. The separating device is screwed onto the extraction plates using three tie rods.

If the extraction forces are directed through the rolling elements, the rolling elements and raceways could be damaged.

Use of a three-section extraction plate prevents damage because the forces act on the tightly fitted inner rings.
